FAQ

---

Once you've located the subtext in your page, click the 'View Subtext' button and you'll be taken to your HTML page. If you can't find the text in the page, use the 'Caret' feature to go to the exact spot where the text starts. We'll use our macro as an example. Step 7. Now that we've found the HTML in the page, we can execute the macro and see what happens. As you can see, the address window is open. Notice that you don't need to insert a street name in this case because the string in the page is complete. If the text didn't appear, you could try clicking on the 'Add City' button, which could bring you back to the source document, or try using the 'Find & Replace' button to replace all occurrences of the address with your desired address. Once you're happy with the information, it's time to save the changes back to the document. You can either open the source document from WebHarvy and save the changes manually, or save them in HTML format and use the File > Save as menu option to save it as a.html file. It's probably a good idea to always save your changes as.html files when using macro text. If you don't, you may end up with a potentially dangerous.htm file that could contain malicious code. It is also recommended that you activate macros before saving. Otherwise, you'll end up with a macro that will cause a problem if the content you're working with contains malicious code. Step 8. One thing that people often forget is to change back to the.html file. That way, you can get back to work if the changes you've made don't end up working the way you want them to. As you can see, the process is easy. There's no need to be a techno-expert to use these features. You just need to be careful in what you search for and then think about what you want to do next. Google's new Google Glass is an example of a device that would be enhanced by using macros. If a person is asked for a specific piece of information such as an address, he can simply use the device to type it in. Since this information will be copied from a Web page, it will automatically have the correct formatting and layout. 82157476af
